

Joint surrogate modelling and reconstruction of Laser-Wakefield Acceleration by invertible neural networks

F. Bethke, R. Pausch, P. Stiller, A. Debus, M. Bussmann, N. Hoffmann

Motivation

Surrogate model for computationally demanding
Laser-Wakefield Acceleration

- Reconstruction of experimental diagnostics requires fast approximation of non-linear mapping

Energy spectrum: generated

Simulation

Method

Invertible Neural Network

- simulation and reconstruction done by same network
- trained bi-directionally
- resolves ambiguous inverse problems
- uncertainty quantification for inverse pass

Results

Comprehensive study on 2.7 TB of training data generated by PIconGPU.

- inference time: 5 ms
- surrogate model: MSE < 0.007
- reconstruction: relative error < 8.2%

Invertible Neural Network

Parameters: reconstructed

Application in Radiation Physics

Very fast interpolation in derived moments of energy spectrum.

1) Peak Energy

2) Full Width at Half Maximum

ground-truth

Posterior of INN

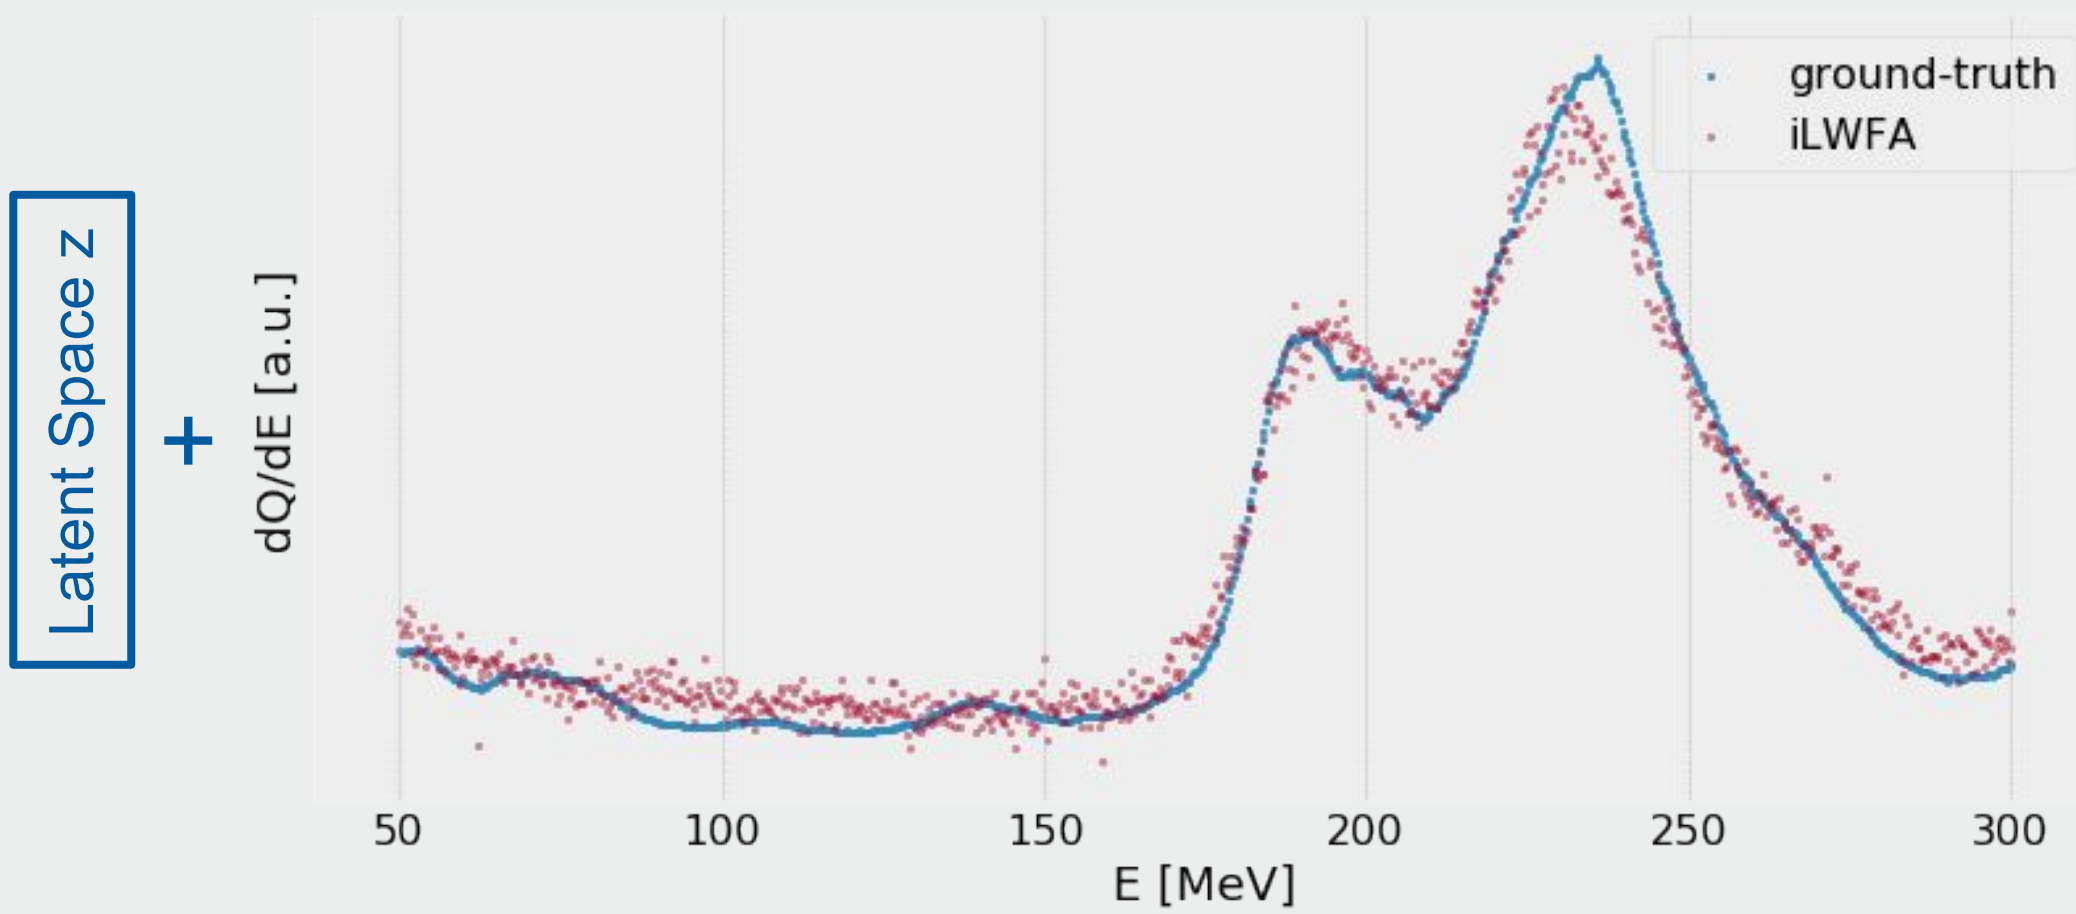

each mode = possible parameter configuration

Joint surrogate modelling and reconstruction of Laser-Wakefield Acceleration by invertible neural networks

Motivation

- **Surrogate model for Laser-Wakefield Acceleration simulation Data** is highly desirable since the simulations are highly computationally demanding even for highly-optimized particle-in-cell codes
- Fast approximation of highly non-linear process to increase the applicability of LWFA techniques

Simulation

Method

- **Invertible Neural Network** with multiple coupling blocks, each having multi-layer subnetworks
- Can run in Forward and Reverse mode
- Subnetworks do not have to be inverted
- Otherwise lost information is projected to the latent space z

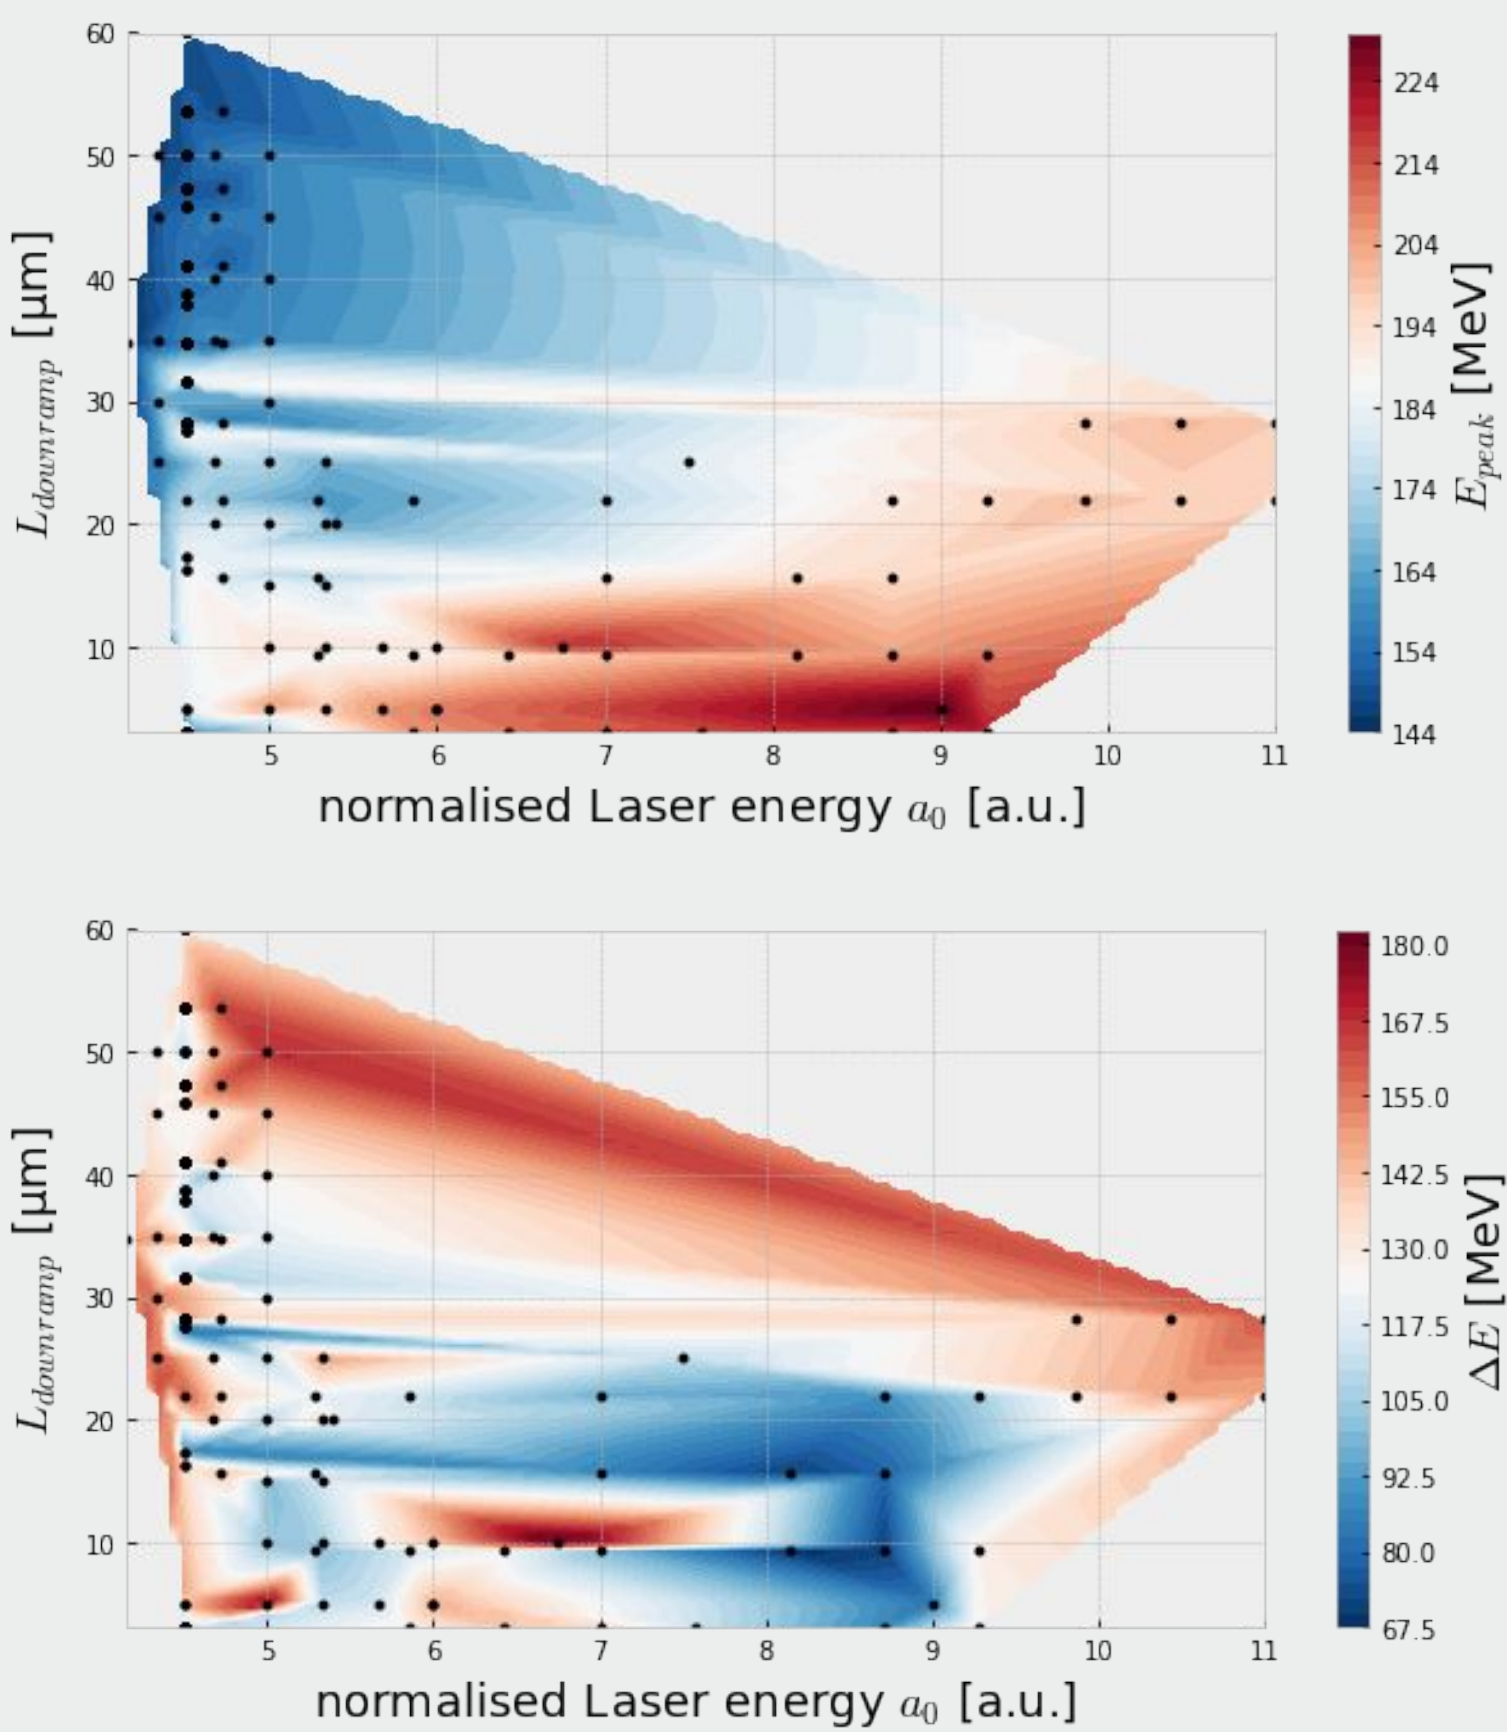

Goals

- **Predict the final energy spectrum** of a laser-wakefield acceleration simulation from simulation parameters and vice versa using an invertible neural network (INN)
- 2.7 Terabytes of training data, generated by large scale PConGPU simulations
- **Recover simulation parameters** from simulation output through sampling the posterior predictive distribution using the latent space of the INN
- Resolve ambiguous mapping
- Uncertainty quantification

Physical Application

- **Fast approximation of the simulation output** with the surrogate model to maximise certain diagnostics on the predicted energy distribution
